CrowdFundConnect

Abstract

This Crowdfunding Application is a full-stack project designed to streamline the fundraising process by connecting project creators and backers. The backend is built using Node.js, ensuring a robust and scalable API to handle user authentication, campaign management, and payment processing. The frontend, developed with React.js, provides an intuitive and responsive user interface, enabling users to browse, create, and support campaigns seamlessly. The data is stored in MongoDB, a NoSQL database, ensuring efficient management of user profiles, campaign details, and transaction records. This combination of technologies creates a secure, user-friendly platform for modern crowdfunding needs.
